The present sequence is that of antisense oligonucleotide ISIS #114626. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 35% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.

The present sequence is that of antisense oligonucleotide ISIS #114643. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 86% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                             /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 20; DB 1; Length 20;

The present sequence is that of antisense oligonucleotide ISIS #114653. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 cereptor 72% inhibition of human Toll-like receptor 70ll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                    Human, Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                        /note= "OTHER = phosphorothicate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

The present sequence is that of antisense oligonucleotide ISIS #114625. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and deoxy gap, is targeted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 47% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                         The present sequence is that of antisense oligonucleotide ISIS #114627. This chimeric phosphorothicate oligonucleotide, having 2'-NOE wings and a deoxy gap, is targeted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 30% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.

The present sequence is that of antisense oligonuclectide ISIS #114631. This chimeric phosphorothicate oligonuclectide, having 2'-MOE wings and a decxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 73% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonuclectide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human Toll-like receptor 4 antisense oligonucleotide ISIS #114644.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

The present sequence is that of antisense oligonucleotide ISIS #114632. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of antisense oligonucleotide ISIS #114644. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune

THE LETT THE SON THE STATE OF T

Human Toll-like receptor 4 antisense oligonucleotide ISIS #114630

```
The present sequence is that of antisense oligonucleotide ISIS #114649. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 91% inhibition of human Toll-like receptor 4 colls. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
/note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 20; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of antisense oligonucleotide ISIS #114630. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the start codon region of human Toll-like receptor 4 mRNA. It exhibits 48% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                     Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                            /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 59% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Such oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                              Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                    /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating Toll-like receptor 4 ge expression, particularly useful for preventing, delaying or treating inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                     Human Toll-like receptor 4 antisense oligonucleotide ISIS #114636.

                        This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 38% inhibition of human Toll-like receptor 4 expression in THP-1 cells. More active oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                               Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.

oligonucleotide comprises a central gap region of 10 2'-
deoxynucleotides, flanked on both sites by 5-nucleotides
wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                         expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of antisense oligonucleotide ISIS #114640. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 87% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                             New antisense oligonucleotides for modulating Toll-like receptor 4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human Toll-like receptor 4 antisense oligonucleotide ISIS #114654.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of antisense oligonucleotide ISIS #114654. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 92% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.

The present sequence is that of antisense oligonucleotide ISIS #114641. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 83% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-MAY-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  responses
 The present sequence is that of antisense oligonucleotide ISIS #114642. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 76% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thi or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                         /mod_base= OTHER
/note= "OTHER = phosphorothioate nucleotides, the
oligonucleotide comprises a central gap region of 10 2'-
deoxynucleotides, flanked on both sites by 5-nucleotides
wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.5%; Score 20; DB 1; Length 20; 100.0%; Pred. The present sequence is that of antisense oligonucleotide ISIS #114647. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 71% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 91% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                        Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a novel nucleotide sequence and protein of a new hepatitis E virus HEV-T1 and the application of the nucleotide sequence and protein in diagnosing, preventing and treating hepatitis. The present sequence is a PCR primer described in the exemplification of the invention
        The present sequence is that of antisense oligonucleotide ISIS #114639. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and decoxy gap, is targeted to the coding region of human Toll-like receptor mRNA. It exhibits 0% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Active oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                            Gaps

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome or meliorating infection by gram-negative bacteria, respiratory discasse, asthma, arthritis, local and systemic contributions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                        TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

This invention relates to a novel method for the treatment of a vascular disease through the administration of a Toll-like receptor-4 (TLR-4) inhibitor to a mammal. The TLR-4 protein has been linked to several disease such as atherosclerosis, restenosis, inflammation and other vascular diseases. Compounds which inhibit the activity of TLR-4, through the inhibition of its receptor, may have vasotropic, antiarteriosclerotic, thrombolytic, cardiant and antiinflammatory activities. This may also be achieved through antisense therapy or gene therapy. The method or the system of the invention may therefore be useful for inhibiting or treating a vascular disease, for example atherosclerosis, transplant atherosclerosis, vein-graft atherosclerosis, thrombosis, restenosis, stent restenosis, or inflammation and other heart disease. The present sequence is that of a PCR primer which was used for reverse transcription polymerase chain reaction amplification of human TLR-4 in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 thrombosis,

A system for inhibiting the biological activity of myeloid differentiation factor 88 (MyD88), useful for treating vascular diseases (e.g. atherosclerosis), comprises an intravascular device and MyD88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a system for inhibiting the biological activity of myeloid differentiation factor 88 (MyD88) which comprises an intravascular device and a therapeutic composition coated upon the intravascular device, the composition comprising a MyD88 inhibitor. The system or method is useful for treating vascular diseases including atherosclerosis, transplant atherosclerosis, vein-graft atherosclerosis, thrombosis, stent restenosis or angioplasty restenosis. It can be used for treating patients suffering from angina pectoris, ischaemias, conditions associated with ischaemias including stroke,

The method of the invention comprises modulating colony stimulating factor-1 (CSF-1) activity in order to modulate the immune response of the animal. Also disclosed is a pharmaceutical composition comprising a modulator of CSF-1 activity and a pharmaceutical carrier. The method or the pharmaceutical composition is useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock. The sequences given in records ACC74129-ACC74161 represent primers and probes used in an example from the invention to detect murine genes
                                                                                                                                                                                                                                                                                                                 Modulating an immune response in an animal, useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock, by modulating colony stimulating factor-1 (CSF-1) activity in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapeutic agent; endothelial disorder; 3-amino-1; 2-benzisothiazole compound; endothelial disorders; toxaemia; severe toxaemia; toxic shock; haemorrhagic shock; alcohol induced cirrhosis; adult respiratory distress syndrome; chronic rheumatoid arthritis; ulcerative gastritis; Crohn's disease; glomerulonephritis; infectious carditis; systemic lupus erythematosus; scleroderma; Sjoegren's syndrome; multiple organ failure; autoimmune disease; multiple sclerosis; PCR; primer; ss; human; toll-like receptor 4; TLR4.

recombination using a gene disruption cassette and a promoter replacement fragment.

Claim 36; SEQ ID NO 5088; 163pp; English.

The invention relates to a grown bathoof for constructing a strain of dilloid funcial called and a branched and a great of a gene, where the first alled of the gene is regulated by a theory and the properties of the second alled of the gene encodes the polypeptide mentioned above; a conception of a gene, where the first alled of the second alled of the gene encodes the polypeptide mentioned above; a conception and where the speem encodes the polypeptide mentioned above; a conception and where the speem encodes the polypeptide continuity of a tungs and encodes and and polypeptide companies and encodes a portion of a diploid fungal and encodes and and the polypeptide companies. A tungs the polypeptide companies are the gene product companies of polypeptide companies, and the polypeptide companies and the polypeptide companie sequence selected from ADP98516-ADP98825. The novel methods and compositions have fungicide activity. The compositions may be used in gene therapy. The composition and methods are useful for drug screening purposes or for diagnosing, preventing or treating infections associated with Candida albicans. These may also be used for constructing strains useful for identification and validation of gene products as effective

ö products as effective targets for therapeutic intervention, and for collecting identified essential genes. This polynucleotide sequence represents an identification primer used in the exemplification of the invention. NOTE: This sequence was downloaded from an electronic sequence listing provided on the WIPO website. for identifying and validating gene Gaps ö Query Match 0.5%; Score 18.2; DB 1; Length 24; Best Local Similarity 87.0%; Pred. Lorenz E, Schwartz DA, Schutte BC;

WPI; 2001-061872/07.

Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNJ amplified from a biological sample encodes a portion of variant toll receptor 4.

Example 1; Page 31; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), syndrome (SIRS) or acute respiratory distress syndrome (ARDS),

BP

```
The present invention relates to a new protein that can be used for avoiding endotoxin shock caused by bacterial infection. The present nucleic acid sequence represents one of a collection (ABK88338-ABK88345) of synthetic TLR4 PCR primers that were used in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An anti-bacterial protein useful for avoiding endotoxin shock caused bacterial infection.
                                                                                                                                                                                                                                                                  Endotoxin shock; bacterial infection; TLR4; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.5%; Score 17.2; DB 1; Length 22; ilarity 86.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAV51401-V51704 are forward PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for
      obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic marker; allele-specific; probe; amplification; PCR primer; hybridisation; plant; hybrid certification; genetic contribution; progeny; back-cross; hybrid; ancestry; corn; ss.

                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                               This invention relates to a novel method of inhibiting differentiation of an osteoclast precursor cell comprises contacting the cell with at least one Toll-like receptor (TLR) ligand, where the TLR ligand stimulates at least one TLR on the osteoclast precursor cell, thus, inhibiting differentiation of the osteoclast precursor cell. The invention may be useful for the development of compounds with an osteopathic activity or for gene therapy. The composition and methods are useful in inhibiting differentiation of an osteoclast precursor cell which may be used in the development of therapies to treat patients suffering from bone loss associated with bacterial infection and bone loss resulting from other diseases. These may also be used in identifying a Toll-like receptor that inhibits differentiation of an osteoclast precursor cell. The present sequence is that of a mouse toll-like receptor (TLR) RT-PCR primer which was used in the exemplification of the invention.
                                                     Inhibiting differentiation of an osteoclast precursor cell, useful for treating bone diseases, comprises contacting the cell with a Toll-like receptor (TLR) ligand that stimulates a TLR on the osteoclast precursor cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide; B-raf; human; inhibitor; T-cell activation; hyperproliferative disorder; cancer; restenosis; psoriasis; atherosclerosis; raf-associated tumour; diagnosis; therapy; ss.

This sequence represents an example of an antisense oligonucleotide of the invention. The oligonucleotides are 8-50 nucleotides in length, and are targeted to a nucleic acid encoding human B-raf and which is capable of inhibiting human B-raf expression. The oligonucleotides is used to inhibit the (abnormal) expression of human B-raf, to inhibit hyperproliferation of cells, to treat or prevent an abnormal proliferation condition, e.g. hyperproliferative disorders such as cancer (e.g. of the brain or nervous system), restenosis, psoriasis or a disorder characterised by T-cell activation and growth. They may also be used to diagnose these diseases, as well as atherosclerosis. The oligonucleotides of the invention may be used to distinguish rafasseociated tumours from tumours having other etiologies. The antisense oligonucleotides can also be used to quantify raf expression in assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis; therapy; cancer; cytostatic; anti-angiogenic; vascular; ophthalmological; antisense; phosphorothioate backbone; B-raf kinase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
New antisense oligonucleotides - for modulation of human B-raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using antisense oligonucleotide modulation of human raf gene expression.
                                                                            The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable cinhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human B-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tumour metastasis; human; raf; raf expression inhibitor; cytostatic; antiarteriosclerotic; antisense-therapy; hyperproliferative disorder; atherosclerosis; tumour; b-raf kinase; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                             Gaps
Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of preventing or treating tumour metastasis in an animal comprising administering to the animal an oligonucleotide 8-50 nucleotides in length, which is targeted to mencoding human raf and capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.
disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human b-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide 8-50 nucleotides in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; 88; antisense; c-raf; a-raf; b-raf; protein kinase; cancer; signal transduction; cell proliferation; lung carcinoma; cytostatic; antisense gene therapy; chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis.
                                                                                                                                                                                                                                               Gaps

determine the bacterial resistance to antibiotics

```
PCR primers AAV37060-61 and AAV37062-63 are used to amplify antibiotic resistance gene aac6'-IIa. They are used in the course of the invention. The specification describes the use of probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and amount of nucleic acids from a bacterial antibiotic resistance gene and specific bacterial or fungal species in any sample suspected of containing the bacterial or fungal nucleic acids, where each of the nucleic acid or variant or part comprises a selected target region by by byzidisable with the probes or primers. The method of use comprises contacting the sample with the probes or primers and detecting the probes or amplified products as an indication of the presence of hybridised probes or amplified products as an indication of the presence of the specific bacterial or fungal species and bacterial and fungal species and genera and
              chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, angiogenesis or neovascularisation (preferably ocular angiogenesis or neovascularisation). The oligo, is also useful for inhibiting hyperproliferation of cells. The oligos, are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide targeting a human raf mRNA
                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to modulating an immune response in an animal. The method of the invention comprises modulating colony stimulating factor-1 (CSF-1) activity in order to modulate the immune response of the animal. Also disclosed is a pharmaceutical composition comprising a modulator of CSF-1 activity and a pharmaceutical carrier. The method or the pharmaceutical composition is useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock. The sequences given in records ACC74129-ACC74161 represent primers and probes used in an example from the invention to detect murine genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating an immune response in an animal, useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock, by modulating colony stimulating factor-1 (CSF-1) activity in an animal.

The invention relates to a splice variant of human HJ06972 (KIAA1079), designated AF06972 (ADD93815), and nucleic acids encoding it (ADD93814). CC designated AF06972 (ADD93815), and nucleic acids encoding it (ADD93814). CC compared to the HJ06972 cDNA (ADD93812), AF06972 cDNA contains an additional 94 bp exon (ADD93816) between bases 4623-4624 of HJ06972 and its splice variant AF06972 are related to apoptosis associated tyrosine kinase (AATYK), a protein which is involved in apoptosis and the differentiation or proliferation of nerve cells, and are likely to have similar activity. The invention also relates to vectors and host cells comprising AF06972 DNA sequences, the recombinant production of AF06972 cusing the antibodies specific for AF06972, an immunoassay method cusing the antibodies, a method for detecting apoptosis regulatory activity, a method for evaluating a compound for its ability to induce apoptosis or nerve cell differentiation or proliferation, and a transgenic non-human animal model in which apoptosis, or nerve cell division and growth has been modified. AF06972 polypeptides and compounds and method for disorders associated with apoptosis, nerve cell growth and division, and hepatitis. Sequences ADD93829-ADD93830 cell growth and division, and hepatitis. Sequences ADD93829-ADD93830 cell growth and example of the invention.
                                                                                                                                                             Mouse; murine; AF06972; mAF06972; KIAA1079; AATYK homologue; apoptosis-associated tyrosine kinase; apoptosis; nerve cell differentiation; nerve cell proliferation; nerve cell division; drug screening; transgenic animal; apoptosis disorder; nerve regeneration; neurological disorder; hepatitis; hepatotropic; anti-inflammatory; virucide; cytostatic; reverse transcription-PCR; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides encoding proteins useful for treating disorders associated with cell growth, division and death and hepatitis.
                                                                                                                         Mouse AF06972 (mAF06972) RT-PCR primer, SEQ ID NO:18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 5 A; 3 C; 5 G; 7 T; 0 U; 0 Other;

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 2877; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent composition of the invention and antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a consumption a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproducticition, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                               Human glucocorticoid receptor-specific antisense oligonucleotide #3302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

This invention describes a novel method for identifying an inhibitor is active potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the inhibitor or is active on at least one but less than all allelic forms of the inhibitor is normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent thuman polymorphic sites described in the method of the invention
     dysplastic lesions, endometriosis or graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21 BP; 5 A; 8 C; 3 G; 5 T; 0 U; 0 Other;

New DNA encoding human phosphomannomutase or its fragments - used to detect mutations associated with carbohydrate-deficient glycoprotein syndrome-1, particularly for prenatal diagnosis.

The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour

Novel antisense compound for modulating expression of human helicase-moi and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.

WPI; 2002-749291/81.

the nucleotide sequence encoding the protein. The DNA or its fragments are used to detect mutation in the PMM2 genes that are associated with the carbohydrate-deficient glycoprotein syndrome type 1 (CDG1). The sequences can also be used to detect expression of PWM2-related cDNA; to express PMM2 or its mutants; and to create transgenic animals for use in drug screening and for studying expression pathways. The expressed proteins are used to screen for agents that modulate activity of PMM2, contents, in competitive or capture assays). Biochemical assays for mutants, in competitive or capture assays). Biochemical assays for popphomannomutase activity are used to identify possible carriers of CDG1 (Jaeken disease). Measuring enzymatic activity in foetal cells (or in parental leucocytes if such cells are unavailable) and detecting mutations in the PMM2 gene makes possible a better prenatal diagnosis of CDG1. Sequences AAV80026-43 represent primers used in PCR and singlestrand confirmation polymorphism (SSCP) analysis of the 8 exons of PMM2 gene. These primers are used to determine the SSCP mutations in the PMM2 ö invention relates to a human phosphomannomutase-2 (PMM2) protein and Gaps Human, antisense gene therapy, phosphorothioate backbone, antisense oligonucleotide, helicase-moi gene, inflammation; ss, helicase-moi-associated condition; infection; tumour formation, 2-MOE nucleotide, 2'-methoxyethyl nucleotide. ö 0.4%; Score 16.4; DB 1; Length 20; 34.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense oligonucleotides, compositions and methods for modulating the expression of helicase-moi. The oligonucleotides are used in treating an animal having a disease or condition associated with helicase-moi, such as inflammation, a hyperproliferative disorder or a condition that arises from RNA-mediated
formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothioate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides
                                                                                                                                                                                                                                                                                                                                               2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating helicase-moi expression, useful for diagnosing, preventing or treating diseases or conditions associated with helicase-moi, e.g. inflammation or hyperproliferative disorders.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mote= "This olligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy; human; NIMA-related kinase 6; never in mitosis gene a-related kinase 6; hyperproliferative disorder; cancer; cytostatic; phosphorothioate; ss.

셤
The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                                                                                                                                                                                                                                       This invention relates to a novel method for evaluating substances for their effectiveness in treating beta-cell hypofunction. Specifically, it refers to the beta cells of the pancreas islets that normally function to synthesise and secrete insulin in response to glucose in the blood. The present invention describes measuring the expression levels of at least one of eight specific genes in the presence of a test substance, to indicate its effectiveness in treating beta-cell hypofunction. Accordingly, this method can be used in the treatment of diabetes, in particular type II diabetes (or non-insulin dependent diabetes mellitus, NIDDM). This oligonucleotide is a murine PCR primer given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymerase chain reaction; PCR; primer; amplify; human; T cell receptor; beta chain; TCR; myelin basic protein; BP; autoantigen; encephalitogen; experimental autoimmune encephalomyelitis; EAE; multiple sclerosis; MS; autoimmune disease; neurological disease; cerebrospinal fluid; therapy; central nervous system; complementarity determining region; CDR; T lymphocyte; optical nerve damage; anterior chamber inflammation; ss.

cerephalomyelitis (EAE), and is the leading candidate as an encephalomyelitis (EAE), and is the leading candidate as an encephalitogen involved in multiple sclerosis (MS). By detecting the presence of a marker TCR variable (V) gene bias in a body fluid which can succind the portion of the target organ, an autoimmune disease (such as a neurological disease) in a human can be identified. This method can also be carried out to detect the pathogenic antigen in a nontarget tissue or organ. By analysing the Vbeta gene repertoire of cerebrospinal fluid (CF), and determining the presence of a Vbeta gene bias, an immune-related disease that targets the central nervous system can be diagnosed. Therapeutic Vbeta peptide sequences can be selected to use as treatment of a disease or condition. The selection is carried out by identifying a Vbeta gene bias in a body fluid that is not the target tissue or organ of the disease, and selecting an immunogenic peptide or the Vbeta gene bias. MS can be treated by identifying corresponding to the Vbeta gene bias. Q an betient and administering peptide corresponding to this region 2 (CDR2) of a V gene peptide on the surface of a T lymphocyte in the CF of a patient and administering a peptide corresponding to this region. These methods can also be used for the diagnosis and immune-related therapy of optical nerve damage and anterior chamber inflammation as well as other human neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diseases

Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensingen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.

Example 1; Page 32; 71pp; English

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention.

The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensinogen) and/or AT1 (type 1 angiotensin II receptor) genes, and comparing the polymorphic pattern with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI), hypertension, atherosclerosis or stroke. They can also be used to predict response to treatments with ACE inhibitors, angiotensin II receptor antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular disease. Libraries of nucleic acids containing polymorphic positions in the 3 genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes Sequence 21 BP; 4 A; 8 C; 2 G; 7 T; 0 U; 0 Other;

Detection of Kawasaki disease factor, useful for the diagnosis of Kawasaki disease, comprises detecting an increase in Vbeta6.5 positive Tcells.

Example 1; Page 6; 36pp; Japanese.

The invention relates to a method of detecting Kawasaki disease by detecting an increase in Vbeta6.5 or Vbeta6.5/Vbeta2.1 positive T-cells. The sequences AAA95531-A95626 represent primers and probes used to PCR amplify and detect the level of expression of Valpha and Vbeta genes in T cells in Kawasaki disease

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE), angiotensin II

receptor type 1 (ATI) and type 2 (AT2), angiotensin II

creceptors 1 and 2. The method comprises determining the sequence at one con more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic positions within these genes, and comparing the pattern obtained from a population of individuals exhibiting a cordiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disorders such as mycocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a treatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-creatment regimen comprising administration of attentment regimen.

Creatment regimen comprising administration of attentment regimen.

Creatment regimen comprising applymorphic site may be used as provides a basis for predicting the outcome of a treatment regimen.

Creatments arrays for high throughput screening. The genes, and the proteins creatmers trial and error in selecting a treatment for a particular drugs. Determination of an individual's polymorphic pattern reduces or calminates trial and error in selecting a treatment for a particular individual cardiovascular patient. It also provides the ability to responsive, or at a risk for an adverse response, to a particular

ö
treatment regimen. Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby decreasing the number of patients required for a clinical trial, which in turn decreases the duration and cost of such trials. Sequences AAA38296-A38315 represent PCR primers used in an exemplification of the invention to amplify short fragments of the human angiotensin II receptor type 1 (ATI) gene regulatory region (AAA38331) for sequence determination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. The PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the

The present sequence is one of a number of primers used in a method for detecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectasia, or a polyexonic cukaryotic gene of at least 4 kb. The method uses an improved version of single-stranded conformation polymorphism (SSCP) electrophoresis that allows electrophoresis of two or three amplified segments in a single lane. The method is useful for screening large, complex polyexonic eukaryotic genes such as the ATM gene for mutations and polymorphisms. The new mutations and polymorphisms in the ATM gene are useful for performing more accurate screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening methods. The mega-SSCP method provides a screening method of genes for multiple polymorphisms and mutations at once. The method is particularly suitable for large, polyexonic, eukaryotic genes, having mutations and polymorphisms at many points and not merely at one or a few hot spots. Note: the SEQ ID assigned to this sequence in the disclosure and claims of the the specification is one

```
The present invention provides the protein and coding sequences of human dipeptide aminopeptidase 28. The sequences can be used in the treatment of cancer, nosohaemia, HIV infection, immunological diseases and inflammation. The present sequence is a coding sequence fragment described in the exemplification of the invention
                                                                                                                                                                                                                                                             /partial
/note= "the sequence contains no start or stop codon"

This invention describes a novel isolated nucleic acid used in a test system for discovering active agents for treating diseases of the nervous compared. The nucleic acid is a mutant form of the murine Thee gene which encodes the CoffE protein, a tubulin-specific chaperone essential for complexation of alpha- and beta-tubulins. The mutant gene has a T to G alteration at position 182, resulting in Gly rather than Trp at C- terminal position 527 of the CoffE protein (corresponding to position 527 of the human protein). This mutation is responsible for progressive motor contacted with the identified diagnostic agent and binding determined, contacted with the identified diagnostic agent and binding determined, contacted with the identified diagnostic agent and binding determined, contacted with test compound and either the survival rate or the contacted with rest compound and either the survival rate or the compared with rest compound and either the survival rate or the formation of embryonal tubulin isoforms, olass III beta-tubulin, ordered tubulin aggregates, microtubuli and/or axons determined and optionally compared with results of controls and/or of cells traced with a compounds are selected if they increase cell survival compound. Compounds are selected if they increase cell survival correspond to tubulin and/or axons. The novel mutation was indentified in pumy/pum index by typing a 31 cM region of chromosome 13. The products of the invention have neuroprotective, noctropic and antiparkinsonian activity and can be used and its derived peptide to industry and can be used and its derived peptide to industry and sense buch as Alzhaimer's disease, Parkinson's disease, neuropathy and multiple sclerosis. Thee or its mutants are also useful in diagnosing can me treating the diseases, Parkinson and inventing the multiple solerosis. The contraction are also useful in diagnosing primer used to amplifate read on the shortestone such as anothered and spaced on the such as anothered and spaced on the such as anothered and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   genes, in cells, tissue explants or organisms, e.g. for treating obesity diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a short interfering nucleic acid (siNA)
                                                                                    short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearcyl-CoA desaturase; RNA interference; ancrectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                      Stearoyl-CoA desaturase siNA oligonucleotide SEQ ID NO:11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.4%; Score 16; DB 1; Length 19; 7.5%; Pred. PCR primers (AAT61331 and AAT77158-86) were designed for amplification of the human Batten disease CLN3 gene (see also AAT61306) exons 1-15. The PCR primers for exon 4 are given in AAT77163 and AAT77164. Novel mutations (see also AAT61332-48) have been discovered in the CLN3 gene of Bd patients using a combination of PCR, single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Batten disease polypeptide - useful to correct absence of wild type polypeptide, or as agonist to enhance activity of wild type polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearcyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity; can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to a compound that is 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and which specifically hybridises with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding Casein kinase 2-beta, or which specifically hybridises with an 8-nucleobase compound, and a carrier or a nucleic acid molecule encoding Casein kinase 2-beta in cells or tissues by contacting the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or tissues with the compound so that the expression of Casein kinase 2-beta is inhibited; and (3) treating an animal having a disease or condition associated with Casein kinase 2-beta by administering to the animal the new compound so that the expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta and for treating diseases or conditions associated with expression of Casein kinase 2-beta, e.g. diabetes or hyperproliferative disorders, particularly cancer, such as breast cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence is an antisense original control of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides targeted to nucleic acid encoding Casein kinase 2-beta, useful in diagnostic and research applications, or for treating a disease or condition associated with the expression of Casein kinase 2-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

AAXO9121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary confammune diseases, inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid reconvented to produce medicaments for the treatment or synchrylaris of segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, PCR; primer; vulnerary; anti-tumour; antirheumatic; antiarthritic; antiarteriosclerotic; cytostatic; neointima; scar; plaque; blood vessel; Toll-like receptor 4; adventitial cell; Tlr-4; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for interfering with the formation of a neointima/scar and/or a plaque in a blood vessel by providing a ligand capable of modulating Toll-like receptor activity of adventitial cells. The method is useful for reducing the formation of a neointima/scar and/or a plaque in a blood vessel after stenting, angioplasty, heart transplantation, by pass surgery, arteriovenous shunting and infection, especially bacterial infection. The method is also useful for modulating tumour growth, and for modulating the effects of returnation arthritis. The present sequence is a PCR primer for human
                                                                                                                                                                                                                                                                                                              Interfering with the formation of a neointima/scar and/or a plaque in a blood vessel, useful for modulating tumor growth, comprises providing a ligand capable of modulating Toll-like receptor activity of adventitial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a novel process for increasing the metabolites of carotene content of a plant. The novel process comprises upregulating at least one gene which encodes carotene hydroxylase activity. The carotene hydroxylase activity. The process is useful for increasing the metabolites of carotene content of a plant, comprising transforming a plant cell from which viable plants may be recovered, using a plant expression cassette, or a DNA construct, and generating viable plants from the cell. The carotene metabolites are useful for increasing zeaxanthin and beta-carotene, including oxygenated carotenoids. This polynucleotide sequence represents an RT-PCR primer used in the process for the expression of the introduced proteins and endogenous carotenoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense siNA that down regulates human PTP-1B expression (SeqID 279)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human, 88, 81RNA; short interfering nucleic acid; siNA;

This invention relates to novel short interfering nucleic acid (siNA)

molecules that downregulate expression of a protein tyrosine phosphatase-

18 (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can

CC (miRNA) or short hairpin RNA (shRNA), all of which can mediate inhibition

CC (miRNA) or short hairpin RNA (shRNA), all of which can mediate inhibition

CC of PTP-1B. The present invention describes sequence-specific post-

CC trancriptional gene silencing in animals using siNA molecules and

CC antisense oligonucleotides to modulate PTP-1B gene expression or

CC activity. Furthermore, these siNA molecules provide useful reagents for a

CC variety of therapeutic and diagnostic purposes, and as such can be used

CC for treating obesity, insulin resistance or diabetes (types I and II), as

Well as for drug screening, target identification and validation, genetic

CC engineering, pharmacogenomics and for studying gene function and gene

CC mapping (for example of single-nucleotide polymorphisms). Accordingly,

CC these molecules exhibit anorectic and antidiabetic activities. This

CC Oligonucleotide sequence is an antisense siNA molecule that targets human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; ss; siRNA; short interfering nucleic acid; siNA; protein tyrosine phosphatase-1B; PTP-1B; RNA interference; RNAi; micro-RNA; miRNA; short hairpin RNA; shRNA; gene silencing; antisense; obesity; insulin resistance; diabetes; anorectic; antidiabetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                          New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity, downregulates expression of a protein tyrosine phosphatase-1B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sense siNA that down regulates human PTP-1B expression (SeqID 94)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

This invention relates to novel short interfering nucleic acid (siNA)

molecules that downregulate expression of a protein tyrosine phosphatase-
molecules that downregulate expression of a protein tyrosine phosphatase-
laber (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can
be short interfering RNA (siRNA), all of which can mediate inhibition
conference of PTP-1B. The present invention describes sequence-specific post-
trancriptional gene silencing in animals using siNA molecules and
antisense oligonucleotides to modulate PTP-1B gene expression or
contivity. Furthermore, these siNA molecules provide useful reagents for a
cotivity. Furthermore, these siNA molecules provide useful reagents for a
cotivity therapeutic and diagnostic purposes, and as such can be used
continued by pharmacogenomics and for studying gene function and gene
mapping (for example of single-nucleotide polymorphisms). Accordingly,
these molecules exhibit anorectic and antidiabetic activities. This
coligonucleotide sequence is a sense siNA molecule that targets human PTP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA, double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; tumour necrosis factor; TNF; human; DNA-RNA hybrid; ss; antibacterial; immunosuppressive; antirheumatic; antiarthritic; anti-HIV; antipsoriatic; antiinflammatory; septic shock; rheumatoid arthritis; HIV/AIDS; psoriasis; inflammation; autoimmune disease; target sequence.
          New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity, downregulates expression of a protein tyrosine phosphatase-1B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

Homo sapiens. Synthetic

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and antisense arranded. They further comprise sense and antisense and antisense oligonucleotide. Specifically, the siNAs cantisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically cynthesised. The invention also relates to kits for the in vitro or in synthesised. The invention also relates to kits for the in vitro or in cynthesised. The siNAs are used to modulate expression of the TNF cyntherapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, conditions. The TNF siNAs have antibacterial, immunosuppressive, conditions are also useful for drug screening, diagnosis, theumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune continificammatory activities. They may be used for treating septic shock, therappeutic target identification and validation, genetic engineering, therappeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the Gaps New short interfering nucleic acid, useful e.g. for treatment and diagnosis of septic shock or rheumatoid arthritis, downregulates expression of the tumor necrosis factor gene. . 0 Query Match 0.4%; Score 15.8; DB 1; Length 19; Best Local Similarity 68.4%; Pred. artery Interference RNA agent useful for treating dyslipidemias, coronary disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 3026; 378pp; English

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have cone or more asymmetrical 2'-O alkyl modifications, the antisense cone or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 clavels or glucose-6-phosphatase levels in a subject; producing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is a crivity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (C) the subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted contemporate is chosen from the HDL/LDL cholesterol imbalance, disorder is chosen from the HDL/LDL cholesterol imbalance, coronary artery disease (CHD) and atheroselevolamia, statin-resistant chiscose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g., breast, colon or treating cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

.. 0 Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss. Gaps .. 0 0.4%; Score 15.8; DB 1; Length 19; ilarity 89.5%; Pred. No. 1.9e+02; Conservative 0; Mismatches 2; Indels Human apolipoprotein B (ApoB) oligonucleotide seqid 408. and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for otherwise unwanted expression of apoB-100, elevated or otherwise unwanted cyslipidaemias, hypercholesterolaemia, statin-resistant connary heart by precholesterolaemia, coronary artery disease (CAD), coronary heart connary artery disease (CAD), coronary heart connibit hepatic glucose production or for treating glucose-metabolism-connary artery disease (CAD) and atherosclerosis. (I) is useful for related disease as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AlDS). This sequence sequence a human apolipoprotein B (ApoB) antisense oligonucleotide that

The specification describes oligodeoxyribonucleotides having contiguous nucleoside subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The oligodeoxyribonucleotides has a sequence of nucleoside subunits fective coligodeoxyribonucleotides has a sequence of nucleoside subunits effective to form a duplex with a target nucleic acid molecule. The coligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3'-P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytotoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation disorders, inflammatory processes, certain genetic disorders, cancers, cetc. . The present sequence represents an oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                              Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and 1-beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young.

                         AAV52721) in the PCR amplification of exon 4 of the human DCOH (PCBD) gene. The bifunctional DCOH/PCBD protein stabilises dimers of hepatocyte nuclear factor-1 beta (HNF-1 beta, see AAW71581) with itself or with HNF-1 alpha (see AAW71559). Mutations of HNF are associated with MODY (maturity onset diabetes of the young) type diabetes. No diabetes-associated mutations were found in DCOH
                  This is a reverse PCR primer designed for use with a forward primer (see

AAZ37471, AAZ37472, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The hyperproliferative gene expression. The antisense inhibition of treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
The oligonucleotides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psoriasis, (systemic) lupus erythematosus, multiple sclerosis, contact dermatitis, rhinitis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents, and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compounds used to treat eg. hyperproliferative conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis;

Haplotype analyses for indirect detection of glaucoma

Claim 18; Page 28; 41pp; English

This sequence represents a PCR primer used in the method of the invention. The method is for detecting the presence of alleles for invention. The method is for detecting the presence of alleles for glaucoma comprising haplotype analysis of human chromosome 2 and 6 respectively, where the haplotypes are associated with loci GLC1B and GLC6p25 respectively. The primers are used to amplify gene sequences to generate information necessary to compile haplotype profiles. The haplotype profiles can be used to detect presymptomatic and symptomatic glaucoma. They can also be used to localise, isolate and identify the GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is enhanced. The haplotype analyses also provide means for identification and following of mutant alleles in pedigrees or populations. Identification of presymptomatic individuals using the methods allows intervention in the disease process and obviates the impact of inheriting a mutant allele causing disease, by medically disrupting the initiation.

Oligonucleotide for treating diseases associated with human tumor necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid arthritis, comprises nucleotide sequence complementary to intron of nucleic acid encoding TNF-alpha.

Example 22; Page 104; 283pp; English.

oligonucleotides optionally have a phosphorothioate backbone, and may algo optionally contain at least one 2'-O-methoxyethyl modification. The oligonucleotides are useful for modulating the expression of human TNFalpha in cells and tissues, reducing a human cell inflammatory response, reducing the blood glucose level in a human and treating a human having a disease or condition associated with TNFalpha. Examples of disease, multiple sclerosis, pancreatitis, rheumatoid arthritis, infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligonucleotides are also useful for modulating the This sequence represents an antisense oligonucleotide sequence which targets a region of the human tumour necrosis factor alpha (TNFalpha) nucleotide sequence. TNFalpha is an important cytokine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that represented by the present sequence which are capable of modulating the TNFalpha gene expression. The function of a selected nucleic acid sequence in adipose tissue

                                                                                                                                                                                                                                                                                Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                           The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothioate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

                                                                                                                                                                                                                                                      Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "OTHER= All phosphorothioate linkages, additionally bases 1-6 and bases 15-20 are 2'-0-methoxyethyl bases, and bases 7-14 are deoxynucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for inhibiting the coverexpression of mdm2 e.g. a hyperproliferative disorder such as cancer of blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound may be compound to the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                               An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; immunosuppressive; antiinflammatory; hepatotropic; cytostatic;

This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to
Novel antisense compound targeted to nucleic acid encoding Fas, Fas ligand or Fas associated protein-1 is useful for inhibiting expression of Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour necrosis factor alpha; TNF-alpha; antiinflammatory; antirheumatic; antiarthritic; antidiabetic; dermatological; hepatotropic; antiasthmatic; inflammatory bowel disease; Crohn's disease; colitis; rheumatoid arthritis; diabetes; pancreatitis; multiple sclerosis; atopic dermatitis; asthma; hepatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating
                                                                                                         The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor
 oligonucleotide which inhibits expression of human tumor necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
apoptosis, and for increasing expression of p21. The present DNA sequency represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 1200; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of

Claim 1; Page 322; 455pp; English.

The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a ceference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also described: (1) an array comprising one or more polynuclectides selected from the genes corresponding to the partial sequences given in ABZ82842 cc to ABZ84764, or their fragments of at least 20 nucleotides, or homologues cy and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject or a known toxic pharmaceutical or industrial agent, comprising: (a) cexposing cells to an agent or isolating cells from a human subject who was exposed to an agent; (b) obtaining the test gene expression profile of or a putatively identified toxic response gene after exposure to a known coxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of the man question for comparing the test profile to the expression profile of a gene with a similar gene after exposure to other known toxic compounds. The methods are useful for exposure to other known toxic compounds. The methods are useful for cox system level. The arrays comprising the human genes are useful for cox system level. The arrays comprising the human genes are useful for coxicological screening of drugs, pharmaceutical compounds and chemicals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified or fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a concine comprising the recombinant virus. The DNA molecule has virucide and immunostimulant activities. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                             DNA molecule derived from a prokaryotic cell, useful for producing a vaccine for treating viral infections comprises at least one modified DNA regions encoding NXB so that no N-glycosylation occurs during expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel isolated retroelement comprising at least 90% identity to a 1402% base pair sequence (S1), given in the specification or to nucleotides 1-1747, 12220-13966, 1-385, 1-40, 1708-1747, 1893-3575, 3576-4556, 4602-6314, 6315-7625, 8745-10600, 8745-10673 or 8745-1072% of this sequence, or its complement. The nucleic acid may be useful in detecting infections, such as those caused by retroviruses. This sequence corresponds to a retroelement associated sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acids related to retrovirus elements from Arabidopsis thaliana, useful for detecting infections, such as those
